Patti JM;

- used in the detection and Porphyromonas gingivalis genes and proteins vaccination against periodontal disease.

Claim 5; Page 47-51; 153pp; English.

A portion (AAR96025) of P. gingivalis 381 haemagglutinin hagA (see also AAR96030) was identified as the product of clone ST2 (AAT30649) isolated from a P. gingivalis 318 genomic library. The haemagglutinin can be obted from transformed host cells and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The haemagglutinin can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)

This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the hagA haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease
    encoding haemagglutinin and/or
                                                                                                                                                                                                                                                                                                                        61 ARIILEAHDVWEDGTGYQMLWDADHNQYGASIPBESFWFANGTIPAGLYDPFEYKVPVNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                480
                                                                                                                                                                                                                                                 P. gingivalis 381 haemagglutinin hagA (AAR96030) was identified as the product of the hagA gene (AAT30654) isolated as an EcoRV fragment of genomic DNA. The haemagglutinin, or portions of it (see also AAR96021-24), can be obtd. from transformed host cells and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The haemagglutinin can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-0CT-2003 to standardise OS field)

This sequence represents the hagh haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease

comprises a 300 kDa complex composed a 45 kDa arginivalis (PG) comprises a 300 kDa complex composed a 45 kDa arginine-specific thiol protease and 44, 15, 17 and 27 kDa adhesins encoded by the ptrR gene (AAT78850), and a 148 kDa lysine-specific thiol protease and 39, 15 and 44 kDa adhesins (see AAW24787) encoded by the ptrR gene (AAT78851). A claimed antigenic complex comprises at least one multimeric protein complex comprises at least one adhesin domain, the complex baving a mol. wt. of over 2000 kDa, and preferably comprises all 9 proteins of the PtrR-PtrK complex (see also AAW24780-85). It can be used in a claimed composition to elicit an immune response directed against PG, and in a claimed method of reducing the prospect of PG infection and/or severity of disease. Antibodies directed against the complex are primed for use in treating PG infection. Unlike whole PG cells or other previously prepared antigens based on fimbriae or the capsule, the PtrR-PtrK complex or component parts are safe and effective antigens.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A low mol.wt. arginine-specific gingipain (AG-1) and high mol.wt. AG (AG-2) were isolated from P. gingivalis strains H66 (ATCC 33277) and W50 (ATCC 53973). The sequences of the proteins were used to design PCR primers and probes to isolate AG DNA. Lambda DASH and lambda ZAP libraries were screened with a probe based on amino acids 11-22 of the AG protein to obtain DNA encoding AG-1 (AAQ83484) and AG-2 (AAQ83489). AG-2 is a prepolyprotein incorporating AG-1. (Updated on 25-MAR-2003 to

Gingipain-2 consists or a SORD protease component non-covalently associated with a 44kD haemagolutinin component. The proteinase is stimulated by glycine containing peptides and glycine analogues. It is inhibited by cysteine protease group specific inhibitors. The protease preparation can be used in immunogenic compositions and vaccines against inflammatory response and tissue damage caused by P. gingivalis in periodontal disease. It can also be used to screen for agents that

The invention relates to a recombinant DNA molecule encoding high molecular weight (mature) Arg-gingipain (AG) protein, which has an enzymatically active procease component (AG-2) and a haemagglutinin component, from P. gingivalis. The nucleic acid is useful for producing mature Arg-gingipain protein. Immunogenic compositions comprising Arg-gingipain are useful for immunising animals including humans against inflammatory response and tissue damage caused by an archaebacterium Porphyromonas gingivalis, which causes progressive periodonticis. Arg-gingipain is also useful for identifying agents that modulate Arg-gingipain is also useful for identifying agents that modulate Arg-gingipain is curvently, whether by acting on the protein in the or preventing the interaction of the proteinase with the protein in the gingival area, such as complement factors C3 or C5. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20;
New recombinant DNA molecule which encodes high molecular weight (mature) Arg-gingipain protein, useful for immunization against inflammation and tissue damage, comprises enzymatically active protease component and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     126
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DVWEDGTGYQMLWDADHNOYGASIPEE--SFWFANGTIPAGLYDPFEYKVPVNADASFSP

PI Progulske-Fox A, Tumwasorn S, Lepine G, Han N, Lantz M, Patti JM; XX DR WPI; 1996-287181/29. DR N-PSDB; AAT30656. XX PT Porphyromonas gingivalis genes and proteins - used in the detection and PT Vaccination against periodontal disease. XX XX PT Porphyromonas gingivalis genes and proteins - used in the detection and PT Vaccination against periodontal disease. XX PS Claim 5; Page 138-143; 153pp; English.	C product of a gene (AAT30656) identified in P. gingivalis 318 genomic DNA. C product of a gene (AAT30656) identified in P. gingivalis 318 genomic DNA. C The haemagglutinin can be obtd. from transformed host cells and used as a conscione to protect humans or animals against periodontal disease. C Expression in Salmonella cells allows prodn. of a live vaccine. The haemagglutinin can also be used to detect the presence of anti-P. C pingivalis antibodies and to raise monoclonal antibodies for diagnostic conspiration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              --DKRTYVLNE 235
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the hagE haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         68

                                                                                                                                                                                                                       67
derived from P. gingivalis 318 genomic DNA. A first open reading frame coded for hagD protease (see also AAR66031). The protease and haemagglutinin can be obtd. from transformed host cells and used in vaccines to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of live vaccines. The haemagglutinin and protease can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the hagb haemagglutinin protein. I polypeptides are used to produce antibodies to organisms associated wiperiodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1343 YIVYRDGTKIKEGLIETIFEEDGVATGNHEYCVEVKYTAGVSPKKCVDVIV-NSTQFNPV 1401
                                                                                                               identified as the product of the prtP gene (ART30653) isolated from P. gingivalis W12 genomic DNA. The porphypain shows homology to the meanagolutinins (see also ARS96026-28 and ARS96030-33) of P. gingivalis 318. It can be obtd. from transformed host calls and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The porphypain and haemagglutinins can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LISKDVTGATKVKYYYAVNDGFPGDHYAVMISKTGTNAGDFTVVFEETPNGINKGGARFG 1282

in a claimed composition to elicit an immune response directed against PG, and in a claimed method of reducing the prospect of PG infection and/or severity of disease. Antibodies directed against the complex are claimed for use in treating PG infection. Unlike whole PG cells or other previously prepared antigens based on fimbriae or the capsule, the PrtR-PrtK complex or component parts are safe and effective antigens. (Updated on 17-OCT-2003 to standardise OS field)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Note: the authors translated the codon GAA for residue 78 as Gly, CCT for residue 272
C;Function:
A;Description: caralyzes the hydrolysis of 1,4-beta-xylosidic linkages in xylans
A;Pathway: xylan degradation
C;Superfamily: Clostridium xylanase A repeat homology
C;Reywords: glycosidase; hydrolase; polysaccharide degradation
F;408-502/Domain: Clostridium xylanase A repeat homology <CXA>

                                                                                                                         COMPLEMENT C3 and C5.
CATALYTIC ACTIVITY: Cleavage of proteins, including collagens and immunoglobulins, with a preference for Arg in P1, and hydrophobic residues in P2 and D3.
ENTYME REGULATION: Requires cysteine for activation and Ca(2+) and/or Mg(2+) for stabilization. It is stimulated by glycine-containing dipeptides. It is resistant to inhibition by proteinase inhibitors in human plasma.
SIMILMARITY: Belongs to peptidase family C25.
"Purification and characterization of a 50-kba cysteine proteinase (gingipain) from Porphyromonas gingivalis.";
J. Biol. Chem. 267:18896-18901(1992).
-!- FUNCTION: Thiol protease which is believed to participate in intracellular degradation and turnover of proteins. Its proteolytic activity is a major factor in both periodontal tissue destruction and in bacterial host defense mechanisms. Activates

endoxylanase from Thermoanaerobacterium saccharolyticum B6A-RI.";

J. Bacteriol. 175:5890-5898[1933]

-!- FUNCTION: Endo-acting enzyme that randomly cleaves the internal xylosidic linkages of the xylan backbone, yielding xylosidic linkages of the xylan backbone, yielding xylosidic linkages of the xylan backbone, yielding the hydrolyzed to xylose molecules by beta-xylosidase (B7 3.2.1.37). The temperature and pH optima for this enzyme are 70 degrees Celsius and 5.5, respectively. Requires at least three xylose residues for catalytic activity. Does not have activity against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE FROM N.A., AND SEQUENCE OF 34-41.

Outer membrane protein B precursor (168 kDa surface-layer protein)
(Surface protein antigen) (Cell surface antigen 5) (Sca5) (rOmpB)
(rOmp B) [Contains: 120 kDa surface-exposed protein (Surface protein antigen) (120 kDa outer membrane protein ompB); 32 kDa beta peptide].
                                                                                                                                                                                            Gaps

Struct. 180. 8:442-446(2001).
-!- CATALYTIC ACTIVITY: Hydrolysis of the B chain of insulin at 13-
-!- CATALYTIC ACTIVITY: Hydrolysis of the B chain of insulin at 13-
-!- CATALYTIC ACTIVITY: Hydrolysis of the B chain of insulin at 13-
-!- CATALYTIC ACTIVITY: Hydrolysis of the B chain of angiotensin
I at 4-Tyr-!-118-5. A good synthetic substrate is Lys-Pro-Ile-Glu-
Phe-|-Phe(NO(2))-Arg-Leu.
-!- CATALOR Binds I calcium ion per subunit.
-!- SUBCELLUIAR LOCATION: Periplasmic.
-!- FTM: Autocatalytically processed.
-!- SIMILARITY: Belongs to peptidase family S53.
